### **GOOD TO MODERATE AIR QUALITY for August 3 & 4, 2015** **Air Quality in Lake County May be Degraded from Smoke Intrusions** **Caution is Urged.**

August 3, 2015 @ 4:00pm -- The Rocky fire is resulting in smoke, haze, and degraded air quality throughout Lake County. Weather forecasts indicate “good” to “moderate” conditions which will help air quality in the Lake County air basin through Tuesday.

The Lake County Quality Management District reports that Air Quality conditions currently are in the good range. The overnight forecast for in areas impacted by smoke is for Moderate to Unhealthy air quality with good returning for Tuesday.

Conditions can change quickly from good to unhealthy, and this may be the pattern for the next few days. Localized areas may experience intermittent particulate levels in the moderate to unhealthy range. All areas of Lake County may be significantly impacted should meteorological conditions worsen.

Lake County Public Health Officer Dr. Karen Tait advises area residents to be cautious in resuming normal outdoor activities. “Variable weather conditions and ongoing fire activity may result in localized areas of reduced air quality, which could still pose health risks to people with underlying health conditions. Since we can’t always predict when and where ‘pockets’ of poorer air quality may occur, it is prudent to be careful until conditions stabilize.” Smokey conditions can cause irritation of the eyes, nose and air passages, which can be hazardous in young children, the elderly, individuals with heart conditions or chronic lung disease such as asthma, bronchitis and other respiratory conditions.

Individuals with asthma, bronchitis, emphysema and other lung or heart diseases should carefully adhere to their medical treatment plans and maintain at least a five-day supply of

prescribed medications. They should limit outdoor activity and unnecessary physical exertion. Air conditioning that recirculates indoor air should be used, when available. Drinking plenty of water to avoid drying of the airways is recommended, unless restricted for medical reasons.

Dust masks are not protective against the most harmful pollutants caused by wildfire smoke that drifts to nearby areas. They are useful in filtering out the ash and larger particles that are encountered in burn areas. Air purifying respirators, such as N-95 filtering face pieces, may be effective in reducing harmful particulate matter, but also increase the work of breathing, can lead to physiologic stress, and are not recommended as a general protective measure.

The “good” to “moderate” air quality forecast results from lower levels of fine particulates in the smoke and the possibility of increased ground level ozone. These are generated when combustion products in the smoke combine with the high temperatures, sunlight, and humidity. Other chemical reactions reduce visibility by forming secondary particulates. Poor air quality, haze, and particulate from the ongoing wildfires are expected to continue throughout Lake County through the week.
